

Cafinity

Management and Ordering System

Complete Features and User Workflow Guide

A branch-based mobile application for browsing, ordering, preparing, and managing café products across Customer, Staff, and Administrator roles.

Document version 1.0

Date generated: June 28, 2026

Application version: Cafinity 1.0.0 · Expo SDK 54

Generated from the current Cafinity application source code.

Document Control

Field	Detail
Document title	Cafinity — Complete Features and User Workflow Guide
Version	1.0
Date generated	June 28, 2026
Source reviewed	Cafinity Expo / React Native (TypeScript) repository — app routes, Zustand stores, Supabase services and RPCs, SQL migrations
Intended audience	Group review, instructor presentation, project documentation, feature verification
Document status	Generated from the current Cafinity application source code.
Privacy	Contains no credentials, keys, tokens, or personal data.

Honesty note. Every feature in this guide was traced through the application's screens, state, services, and database functions. Features that are simulated, depend on a device build, or require manual setup are listed plainly in Appendix A so the scope is represented accurately.

1. System Overview

Cafinity is a branch-based café ordering and management system delivered as a single mobile application. The same app serves three kinds of users — customers, baristas (staff), and administrators — and shows each of them a different experience based on the role stored on their account.

It solves a set of everyday café problems in one place: customers can browse a branch's real menu and place orders for immediate or scheduled pickup; baristas receive those orders in a live, first-in-first-out queue for their branch and move each order through preparation; and administrators manage inventory, menu, users, branches, promotions, business rules, and reporting.

Main user groups

- **Customer** — browses, customizes, orders, pays (simulated), tracks pickup, earns rewards, and leaves feedback.
- **Staff / Barista** — processes the order queue for an assigned branch and prepares orders.
- **Administrator** — configures and oversees the whole system across authorized branches.

Main system areas

- Customer ordering (menu, product customization, cart, checkout, tracking, receipt).
- Rewards and loyalty (points, challenges, vouchers, streaks).
- Branch operations (live order queue, payment confirmation, preparation).
- Administration (dashboard, reports, inventory, menu, users, campaigns, settings, feedback).

Technology, briefly

The app is built with Expo (SDK 54) and React Native using TypeScript, with Expo Router for navigation and Zustand for in-app state. Data, accounts, and business logic live in Supabase (PostgreSQL), where sensitive operations run through database functions (RPCs) protected by Row-Level Security so the rules can't be bypassed from the app.

Figure 1 — Branch-based ordering at a glance

Figure 1. Each role acts on the same order data from a different vantage point.

2. User Roles and Access

Access is decided by the role on the signed-in account and, for staff, by their branch assignment. When the app starts, it reads the account's role and routes the user to the matching experience; protected screens and database functions re-check the role and branch on every sensitive action.

Role	Main purpose	Typical access
Customer	Browse and order café products	Customer ordering, rewards, order tracking, profile
Staff / Barista	Process branch orders	Operations for the assigned branch only (or all branches if explicitly granted)
Administrator	Manage the Cafinity system	All authorized branches and every management tool

Enforced, not assumed. Role and branch limits are enforced in the database (Row-Level Security plus role checks inside functions), not only by hiding buttons in the interface. A barista assigned to one branch cannot read or change another branch's orders even by altering a request.

3. Shared System Features

These behaviors apply across roles where relevant.

Feature	Behavior	Who
Branded launch screen	A short Cafinity loading screen appears at cold start while the saved theme and session load.	All
Login & authentication	Email/password sign-in and registration via Supabase Auth, with session restoration on reopen.	All
Role-based routing	After sign-in the app routes to the Customer, Staff, or Admin area based on role.	All
Light / Dark / Use device	An appearance control switches the whole app's theme; the choice is saved.	All
Seasonal themes	An active campaign can apply seasonal accent colors and imagery on the base theme.	All
Profile & sign out	Each role has a profile area with account details and a sign-out action.	All
Loading / empty / error	Spinners, friendly empty messages, and retryable error states.	All
Offline handling	An offline banner appears when connectivity is lost; network actions are guarded.	All
Local notifications	On-device notifications via Expo Notifications.	All (App. A)
Safe-area & responsive	Screens respect safe areas and adapt to common phone widths.	All
Branch status indicators	Open / closed and “no longer available” states wherever a branch is chosen.	Customer, Staff

4. Customer Application

4.1 Customer Journey Overview

The typical customer path, in order:

1. Open Cafinity and view the branded launch screen.
2. Sign in or create an account.
3. Choose or confirm a branch.
4. Browse the branch menu.
5. Open a product and read its details.
6. Select size and customizations.
7. Add the item to the cart.
8. Review the cart.
9. Choose immediate or scheduled pickup.
10. Apply a voucher or promo, optional discount, tip, and payment method.
11. Place the order.
12. Receive order confirmation.
13. Track preparation.
14. Present the pickup number or QR at the counter.
15. View the digital receipt.
16. Earn loyalty points.
17. Submit feedback after the order completes.
18. Reorder or review order history.

4.2 Customer Authentication

- Registration with first/last name, email, and password.
- Login with email and password; a show/hide control reveals the password.
- Session restoration — a returning customer stays signed in until they sign out.
- Role-based redirection — a customer account opens the customer experience.
- Sign out from the profile area.

Note. A dedicated “forgot password” reset flow is not a verified part of the current customer screens; see Appendix A.

4.3 Branch Selection

- Manual selection from active branches.
- Nearest-branch suggestion using device location when permission is granted.
- Open / closed status with each branch's opening and closing hours.
- Closed or inactive branches are flagged; immediate ordering is blocked while closed, with scheduled pickup offered instead.
- The menu and stock shown are specific to the selected branch.

- Changing branches re-validates the cart: items unavailable at the new branch are flagged, not silently dropped.

4.4 Home Screen

- A personalized greeting and the selected branch.
- A seasonal campaign / promotion highlight when active.
- Featured products and quick entry into the menu.
- An active-order indicator linking to live tracking.
- A rewards shortcut and quick actions.

4.5 Menu and Product Discovery

- Products grouped by category, with search.
- Product images with graceful fallbacks when missing.
- Branch-specific availability — out-of-stock or hidden items show as unavailable.
- Seasonal / campaign badges on applicable products.

4.6 Product Details and Customization

- A full-width product image pinned at the top that smoothly shrinks (never to a tiny thumbnail) on scroll.
- A solid summary strip beneath the image with the name, current price, and selected temperature/size — text never overlaps the photo.
- A full-screen image viewer opened by tapping the image or the expand icon; closeable via button, Android back, or tapping outside.
- Size selection and customization groups; required groups must be chosen before adding to the cart.
- A quantity control (max 20 per item) and a live price that updates with each choice.
- Validation scrolls to the first incomplete required group instead of failing silently.

4.7 Cart

- Review of each line with size, customizations, and price.
- Change quantity, edit an item, or remove it (with undo).
- Branch inventory conflicts are flagged per line with a specific reason.
- A clear subtotal and entry to checkout; checkout is blocked while unavailable items remain.

4.8 Checkout

Checkout is presented in the order the customer reads it on screen:

- Pickup card showing the branch with open/closed status and a Change option.
- Pickup time — “As soon as possible” or “Schedule for later” (a compact date → time picker offering only valid in-hours slots).
- Rewards & vouchers, a promo code field, and an optional PWD / Senior Citizen discount (cash-only; needs cardholder name and ID).
- Optional tip and a barista note.
- Payment — simulated GCash (adjustable demo balance) or Cash at the counter.

- An order summary with subtotal, discounts, tip, VAT, total, and points to earn.
- A persistent action bar: blocking errors appear directly above Pay, the button is disabled while unresolved, and duplicate submissions are prevented by a unique checkout request id.

Validation & failures handled: offline state, closed or no-longer-available branch, a scheduled time not chosen, insufficient simulated GCash balance, and uncertain-network submissions (the app offers to check status rather than charging twice).

4.9 Order Confirmation and Tracking

After placing an order the customer sees a confirmation and can track progress. Implemented order statuses are:

- Pending (order received / scheduled).
- Preparing.
- Ready for pickup.
- Completed.
- Cancelled.
- A pickup number and a pickup QR code for active orders.
- An estimated readiness time (ETA) when enabled by the administrator.
- “What happens next” guidance, the cash-payment status, and refund status when relevant.
- Cancellation eligibility based on the order's stage.

4.10 Cancellation and Refunds

- A customer may cancel before preparation begins (cutoff configurable by the administrator).
- A cancellation reason may be requested.
- Refund status is tracked and shown: none, refund pending, partially refunded, or refunded.

4.11 Digital Receipt

A paper-style digital receipt shows the order reference, branch, pickup number, items and customizations, subtotal, discounts, loyalty redemption, tip, VAT, total, payment status, and points. It can be exported as a PDF and shared through the device's share sheet.

4.12 Rewards and Loyalty

- A points balance and points earned per purchase (earn rate is an admin setting).
- Points activity history.
- Loyalty challenges with progress, and claimable rewards with locked / completed states.
- Vouchers — available and used — applied at checkout.
- A daily streak that encourages repeat visits.

4.13 Feedback

- Feedback becomes available after an order is completed.
- A star rating, selectable tags, and an optional comment.
- Duplicate prevention so an order is reviewed once.
- Submitted feedback appears to administrators and feeds rating metrics.

4.14 Customer Profile and Preferences

- Profile details with an edit-profile screen and avatar.
- Order history and a rewards shortcut.
- A notifications screen and notification handling.
- Appearance control (Light / Dark / Use device).
- Sign out.

5. Staff / Barista Application

5.1 Barista Journey Overview

1. Sign in.
2. The system verifies the staff role.
3. The assigned branch is loaded (locked unless all-branch access is granted).
4. View the branch order queue.
5. Review a new order.
6. Confirm payment for cash orders when required.
7. Start preparation.
8. Mark the order ready.
9. Complete pickup.
10. Continue to the next eligible order.
11. Review scheduled orders.
12. Open the assigned-branch report when needed.
13. Sign out.

5.2 Branch Access

- A barista is locked to their assigned branch, shown as a locked “Assigned branch” row with no change control.
- All-branch access is available only when an administrator explicitly grants it.
- If no branch is assigned (and no all-branch grant), the queue shows a clear “No branch assigned” message with sign-out and guidance — it never defaults to all branches.
- Limits are enforced in the database (Row-Level Security on reads and a branch-check on order updates), so another branch's data cannot be reached by tampering.
- Administrators may act across all authorized branches.

5.3 Order Queue

- A first-in-first-out queue with each order's pickup/reference number, time received, waiting time, item count, and payment status.
- Search by order number, plus status filters (new, preparing, ready, unpaid) and sorting.
- Live updates as new orders arrive, with a new-order indicator and optional vibration cue.
- An oldest-waiting indicator highlights delays.

5.4 Payment Confirmation

- Cash orders show an unpaid state and must have payment confirmed before preparation.
- A Confirm-payment action moves the order forward, guarded against double taps.

5.5 Order Preparation

The queue shows the one valid next action for each status:

- Confirm / accept (and confirm cash payment where needed).
- Start preparation → the order becomes “Preparing.”

- Mark ready → the order becomes “Ready for pickup.”
- Complete pickup → the order becomes “Completed.”

5.6 Scheduled Orders

- Scheduled orders carry a scheduled badge and pickup time.
- They sort by effective pickup time so a far-future order never jumps ahead of current immediate orders.
- Orders due soon surface for preparation at the appropriate time.

5.7 Staff Order Details

- The customer's note, products, variants, and customizations.
- Payment method and discounts, pickup details, and the order reference / QR.
- Cancellation or issue states when present.

5.8 Staff Inventory or Menu Tools

Current scope. Inventory and menu management are part of the administrator area. The barista experience centers on the order queue and processing for the assigned branch; it does not expose administrator-only inventory or menu editing (see Section 8).

5.9 Branch Reports

- A barista can generate a report for their assigned branch from the staff account area.
- Date presets (Today, Yesterday, This week, Last week, This month, Last month) and a custom range.
- A PDF sales summary, an Orders CSV, and a Product-sales CSV.
- The branch is locked to the assignment; a barista cannot export another branch's detailed orders unless all-branch access is granted — enforced by the report database functions, not only the interface.

5.10 Staff Profile and Preferences

- Profile details and today's tallies (served, active, ready, sales).
- Appearance control (Light / Dark / Use device).
- A “vibrate on new order” preference and sign out.

6. Administrator Application

6.1 Administrator Journey Overview

1. Sign in; the system verifies the administrator role.
2. Review the dashboard and choose a reporting period.
3. Review revenue, orders, ratings, and alerts.
4. Investigate low-stock items.
5. Manage inventory.
6. Manage menu products.
7. Manage users and branch assignments.
8. Manage campaigns and themes.
9. Update business settings.
10. Generate PDF or CSV reports.
11. Review feedback and operational trends.
12. Sign out.

6.2 Dashboard

- A period selector — Today, This week, This month.
- Revenue headline with a comparison versus the previous equivalent period.
- Key figures: orders, average order value, and average rating.
- An analytics chart switchable between Revenue and Orders.
- A short, data-driven performance insight (computed from real figures, never invented).
- A “Needs attention” low-stock summary that opens Inventory.
- Quick actions (Reports, Add product, Inventory, Campaigns).
- Top sellers (expandable), Recent feedback, and Cancellation reasons.
- Clear section spacing and headings; the final section clears the bottom navigation bar.

6.3 Reports and Data Analysis

Administrators generate reports for all branches or a specific branch, using date presets or a custom range. Metrics use order-time recorded values (not recomputed from today's prices). Reported figures include:

- Gross and net sales (net after refunds) and average order value.
- Completed, cancelled, and refunded order counts.
- Total discounts, loyalty redemptions, tips, and VAT included.
- Cash sales and simulated GCash sales.
- Product performance and, for all-branch reports, branch performance.
- Sales by day and payment-method distribution.
- Scheduled-order count and a customer-feedback summary (average rating, count, common tags).

Honest scope. Average preparation time is not reported because the schema records no actual completion timestamp; the report omits it rather than estimate it (see Appendix A).

6.4 Report Export

- A PDF management summary (branded, always light/printable), an Orders CSV, and a Product-sales CSV — or all three at once.
- Files use safe, descriptive names including the branch scope and date range (e.g., `Cafinity_Sales_All_Branches_2026-06-01_to_2026-06-30.pdf`).
- Generation shows step progress and opens the system share sheet.
- Branch and date scope are applied; access is restricted by role (Sections 5.9 and 8).

6.5 Inventory Management

- Choose a branch, then search products and sizes.
- Filters for All, Low, Out, and Hidden.
- Expand a product to see each variant's stock and visibility.
- Stock is edited as a draft — nothing saves on its own.
- A sticky “N unsaved changes” bar offers Discard or Save Changes; a review step appears for risky batches (several changes, a zero-out, or a large reduction).
- Validation requires whole, non-negative numbers; an all-or-nothing save with conflict detection prevents overwriting another admin's change.
- Saved changes update low-stock indicators and flow to the customer menu; loading, retry, and empty states are handled, and the screen cannot get stuck on a spinner.

6.6 Menu Management

- Add and edit products.
- Set product image, description, and category.
- Manage sizes/variants, prices, and customization groups.
- Control product availability and visibility.

6.7 User Management

Baristas

- A searchable list with role labels.
- Branch assignment: assign one branch, or grant All-branch access (with a confirmation warning).
- Branch access is applied by an admin-only database function; baristas cannot change their own assignment.

Administrators

- Listed with a “You” indicator for the current user and their role.

Customers

- Listed with profile details (and loyalty information where available).

Users are segregated by role and sorted for quick scanning. Only administrators can change roles or branch access; customers never see these controls.

6.8 Campaigns and Themes

- Manage promotional campaigns with active, upcoming, and expired states.
- Seasonal themes with an active theme and accent colors.

- Applying a campaign/theme updates seasonal accents and applicable product visibility app-wide.

6.9 Business Settings

Settings are organized into the categories the application uses:

Category	Representative controls
Pricing & Taxes	VAT registered, VAT rate, “menu prices include VAT,” show VAT in breakdown
Fees & Tipping	Enable service fee, fee type, “service fee is taxable,” allow tipping
Loyalty & Rewards	Points earned per peso (loyalty earn rate)
Discounts & Cancellations	Customer cancellation cutoff, require a cancellation reason
Branch & Preparation Time	Show ETA to customers, base prep minutes, minutes per item, max ETA
Developer tools & change history	Loading-screen preview and an audit / recent-changes list

Changes are recorded so administrators can see recent configuration history.

6.10 Feedback Management

- An average rating and a list of customer feedback.
- Comments and tags, with the related order reference where available.
- Filtering to focus on specific feedback.

6.11 Administrator Profile and Appearance

- Profile details, role, and membership date.
- Shortcuts to Campaigns & Themes and to Settings.
- Appearance control (Light / Dark / Use device) and sign out.

7. End-to-End Order Lifecycle

The figure below shows how the three roles act on the same order from creation to completion.

Figure 2 — End-to-end order flow

Figure 2. Normal path. Alternative paths are summarized below.

Alternative paths

- **Closed branch** — immediate ordering is blocked; scheduled pickup or another branch is offered.
- **Scheduled pickup** — the order waits and surfaces in the queue near its pickup time.
- **Out-of-stock conflict** — the cart flags the affected line; the server re-checks stock atomically at placement.
- **Failed payment / insufficient balance** — the order is not placed; the cart is kept and a clear message shows above Pay.
- **Cancellation** — allowed before preparation; a reason may be recorded.
- **Refund** — tracked as refund pending, partially refunded, or refunded.

8. Role Permissions Matrix

Each cell reflects what the current implementation allows.

Feature	Customer	Barista	Administrator
Browse customer menu	Yes	No	Yes (mgmt view)
Place an order	Yes	No	No
Track own order / receipt	Yes	No	Via reports
Earn & redeem rewards	Yes	No	No
Submit feedback	Yes	No	Reviews feedback
Process order queue	No	Assigned branch	All authorized branches
Confirm cash payment	No	Assigned branch	Yes
Advance order status	No	Assigned branch	Yes
Update inventory	No	Not implemented	Yes
Manage menu / products	No	No	Yes
Generate reports	Receipt only	Assigned branch	All or selected
Manage users & access	No	No	Yes
Configure business settings	No	No	Yes
Manage campaigns & themes	No	No	Yes

Status legend: Yes · No · Assigned branch only · All authorized branches · View only · Not implemented.

9. System Rules and Validation

- **Branch-specific inventory** — menu availability and stock are per branch.
- **Closed-branch restriction** — immediate orders require an open branch; scheduling allows valid future in-hours times.
- **Scheduled pickup validation** — only valid in-hours future slots can be chosen (lead time and booking horizon respected).
- **Quantity limit** — a maximum of 20 of any single item.
- **Required customization** — required groups must be completed before adding to the cart.
- **VAT** — applied per tax settings (registered, rate, inclusive pricing, breakdown visibility).
- **Discounts** — promo, vouchers, and PWD/Senior; one benefit per order, PWD/Senior is cash-only.
- **Tips** — optional; go to staff and earn no points.
- **Cash confirmation** — cash orders must be confirmed by staff before preparation.
- **Simulated GCash** — an in-app demo balance stands in for a real gateway.
- **Loyalty points** — earned on eligible spend at the configured rate; redeemable as vouchers/rewards.
- **Cancellation cutoff** — customers may cancel before preparation begins (configurable).
- **Refund status** — none, pending, partial, or refunded.
- **FIFO queue** — staff process by effective time; scheduled orders sort by pickup time.
- **Role & branch access** — enforced in the database, not only the interface.
- **Server-authoritative ordering** — pricing, stock deduction, and points are computed atomically server-side to prevent overselling and double charges.

10. Reports and File Outputs

File	Who can generate	Contents	Scope
Digital receipt (PDF)	Customer (own order)	Reference, branch, pickup number, items, discounts, loyalty, tip, VAT, total, payment, points	Single order
Sales summary (PDF)	Admin; barista (own branch)	Executive summary, sales by day, top products, payment methods, branch & feedback summary	All / selected; barista limited
Orders CSV	Admin; barista (own branch)	One row per order with totals, discounts, tip, VAT, refund, status	Same as above
Product sales CSV	Admin; barista (own branch)	One row per sold line (product, variant, quantity, unit price, line total)	Same as above

All exported files are created on the device and opened through the system share sheet, where they can be saved or sent. Exports respect the chosen date range and the branch limits in Sections 5.9 and 8. CSV files are UTF-8 encoded for reliable spreadsheet import; PDFs use a fixed, printable (always-light) layout regardless of the app theme.

11. User-Facing States

The application handles these states with clear messaging and, where useful, a retry:

- **Loading** — spinners while data is fetched.
- **Empty data** — friendly empty messages (empty cart, no orders, no feedback).
- **Search, no results** — a “no items match” message.
- **Offline** — an offline banner; network actions guarded.
- **Server error** — a readable error with retry (no raw database details).
- **Permission denied** — blocked by the backend; unauthorized branch data is not returned.
- **Location denied** — falls back to manual branch selection.
- **Closed branch** — immediate ordering blocked, scheduling offered.
- **Invalid schedule** — only valid slots are selectable.
- **Out of stock** — flagged in the cart and re-checked atomically at order time.
- **Payment failure / insufficient balance** — order not placed, cart kept.
- **Refund pending** — shown on the order and receipt.
- **Unauthorized route** — users are routed to their permitted area.
- **No branch assigned (staff)** — a clear message with sign-out and guidance.

Appendix A — Current Limitations and Partial Features

These items are part of the project's scope and are represented honestly. None is a failure; each note explains the current purpose.

Item	Status	Explanation
GCash payment	Simulated	An in-app demo balance stands in for a real gateway; Cash is a real in-person flow confirmed by staff.
Push notifications	Device-dependent	On-device (local) notifications work; remote push requires a development/EAS build and device registration.
Nearest-branch (GPS)	Permission-dependent	Uses device location when granted; otherwise the customer selects a branch manually.
PDF / CSV sharing	Device-dependent	Sharing opens the system share sheet and depends on apps installed on the device.
Average prep time	Intentionally omitted	No actual completion timestamp is recorded, so this metric is left out rather than estimated.
Forgot-password reset	Not verified	A dedicated reset flow was not confirmed in the current customer screens.
Barista inventory editing	Not implemented	Inventory editing is an administrator capability in the current build.
Database migrations	Manual setup	New SQL migrations must be run in Supabase for the latest features (scheduled orders, inventory save, reports, barista branch access).
Standalone APK	Requires EAS build	Installable testing requires an Expo Application Services build; the app otherwise runs via Expo.

Appendix B — Presentation Walkthrough

A short sequence for a live demonstration.

Customer demonstration

1. Launch the app and sign in.
2. Select a branch.
3. Open a product and enlarge its image.
4. Customize the item and add it to the cart.
5. Choose scheduled or immediate pickup and a payment method.
6. Place the order and show the confirmation and tracking.

Barista demonstration

1. Sign in as a barista and show the locked assigned branch.
2. Find the new order in the queue.
3. Confirm cash payment if applicable.
4. Start preparation, then mark the order ready.
5. Complete pickup.

Customer continuation

1. Refresh the order status and show the pickup QR.
2. View the digital receipt and the earned points.
3. Submit feedback.

Administrator demonstration

1. Open the dashboard and switch reporting periods.
2. Show revenue, orders, and the low-stock alert.
3. Open Inventory, edit stock, and use Save Changes.
4. Show role-separated users and a barista's branch assignment.
5. Open Settings, then generate a PDF or CSV report.

Appendix C — Document Scope and Verification

Repository areas reviewed for this document:

- Customer routes: home, menu, product details, cart, checkout, order tracking, receipt, rewards, orders, profile, branches, notifications, reorder.
- Staff routes: order queue, order details, account.
- Administrator routes: dashboard, reports, inventory, menu, users, manage, settings, campaigns, cancellations, feedback, product editor.
- State stores (Zustand): authentication, cart, branch, appearance, seasonal theme, network, staff preferences.
- Services and helpers: Supabase client and API layer, scheduling, branch hours, pricing/format, report data and export (PDF/CSV), receipt HTML, errors, notifications.
- Database: SQL migrations and functions (RPCs) for order placement, status transitions, cancellation/refund, pricing/VAT, loyalty, scheduled orders, inventory save, reports, and barista branch access; Row-Level Security policies.

Change-safety confirmation. This was a documentation-only task. No application source code, Supabase data, migrations, users, or settings were modified, and no credentials, keys, tokens, passwords, or personal data are included in this document.
